

DATA SHEET

Trustwave Advanced Security Operations Centers

► REAL-TIME OPERATIONS TARGETING REAL-TIME THREATS

Benefits

- Full lifecycle security operations covering real-time threat monitoring, initial detection and response operations, breach containment and remote remediation assistance as needed
- Highly experienced and certified SpiderLabs security analysts, consultants and threat researchers located at every ASOC location world-wide
- Real-time operation of federated ASOCs means real-time updates of global threat intelligence into Trustwave managed solutions as well as incident response procedures world-wide
- Follow the sun operations ensures incidents are continuously worked from start to finish, non-stop by the best security minds in the business
- Seamless, global support for Trustwave specific security solutions as well as a growing number of strategic third party partners & solution providers

Global cybercrime is reaching epidemic proportions, with advanced threats continuously evolving in real-time, targeting businesses of all shapes and sizes. Security point products are failing to stem the tide and most organizations continue to be challenged with the worldwide shortage of experienced security personnel. And the outlook is not getting any better.

Managed Security Services are an effective way to extend your security team, optimize your security resources and respond to the cybercrime epidemic. But an MSSPs operations must match up against those of its adversaries, requiring responsive, real-time, federated operations on a global scale. Trustwave's Advanced Security Operations Centers (ASOCs) are uniquely designed to reflect the nature of today's threat environment to protect and defend our customers whenever and wherever their operations are world-wide.

Trustwave Advanced Security Operations Centers

Overview

Trustwave delivers its Managed Security Services through a global network of federated ASOCs strategically located on major network peering points throughout the world. To fully leverage this enhanced visibility, Trustwave architected a globally federated operations infrastructure which features unrivaled real-time threat intelligence, big data analytics and advanced security automation tools for incident response operations all backed up by our world-class SpiderLabs security team. The net result is a global capability to combat cybercriminals on an unprecedented scale to protect and defend our customers.

Another unique benefit to Trustwave ASOCs lies in their ability to cover every aspect of a security incident or potential breach all the way from initial detection to final resolution when your network and business are returned back to steady state operation. This includes 24x7 threat monitoring and detection operations, but then goes above and beyond to support incident response, breach containment and remediation activities needed to return your business to normal. Having all of this capability under one roof helps accelerate the entire lifecycle, greatly reducing coordination overhead and removes process latency every step of the way so that potential damages or data loss are minimized to the greatest extent possible.

Federated operations means that all of Trustwave's ASOCs are leveraged globally on our customers' behalf so that regardless of where a new threat initially emerges, all of Trustwave's ASOCs are immediately updated in real-time. SpiderLabs threat intelligence feeds are pushed down to all affected managed devices and ASOC incident response procedures across the globe are updated as well, ensuring that all Trustwave customers are protected.
